The Controlgrips

Switch gears for power. Determine the direction

A SEABOB is the absolute embodiment of state-of-the-art technology. The pilot steers his water sports craft via two intelligent Controlgrips with Piezo technology.

The drive mechanism is activated by squeezing the trigger. Applying light pressure to the green sensor accelerates the device in continuous powerful thrusts until the desired speed is reached. Propulsion is reduced by pressing the red sensor, thereby slowing down the SEABOB. If required, the craft can be brought to an immediate stop simply by releasing the trigger.

Two further Piezo buttons enable the pilot to program an individual data menu. This includes the electronically-controlled setting of diving depth, operation time and additional parameters.
